This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  *tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                               This is the nucleotide sequence bimolecular ribozyme RzA fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to anuclaic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3.-UNNXNN-5. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sucleotide sequence at a specific cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   l. .6

This is the nucleotide sequence of ribozyme deltaRzPl.2. This ribozyme cleaves substrate SPl.2 (see AAZ57634). The invention relates to a nucleic acid enzyme (e.g. deltaRzPl.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The cubstrate of the enzyme has the sequence 5'-H*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleave sibstrate (cleavage site of the substrate (cleavage site of the substrate cannelectide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HDV; HDV dFr45; HDV dPr47; HDV dFr73; HDV dFr910; HDV dFr48; HDV dFr644; satellite virus; HBV; SHD; LHD; antigenomic RNA; viral replication;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid from hepatitis D virus, useful for detection,
                                                                                                                                                                                                               New construction of nucleic acid enzyme useful for biotechnological, diagnostic and therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleotide sequence of the complete genome of HDV variant Pt62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 95.7%; Score 35.4; DB 3; Length 57; Best Local Similarity 73.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                             This is the nucleotide sequence of a trans-acting antigenomic delta Tibozyme of the invention. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRZP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= d

The present sequence represents the complete genome of a hepatitis D virus (HDV) variant. The specification describes the genomes of HDV variants dFr45, dFr47, dFr73, dFr910, dFr48, and dFr64. HDV is a satellite virus of HBV. HDV replicates independently of HBV, and the only two HDV proteins retrieved (sHD and LHD) code for antigenomic RNA. SHD and LHD represent the short (24 kDa) and long (27 kDa) forms, respectively, of the HDV protein. During replication, the functions of these forms of the protein oppose each other: sHD plays an active role in viral replication, while LHD stops it and plays a role in viral particle assembly. Polynucleotides and plypes a role in viral particle detection and genotyping of hepatitis D virus, e.g. for diagnosis and
                                                                                                                                                                                                                                                                                                                                                                           ö

A dengue virus recombinant replicon has a deletion of the complete coding sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of

```
ö
NSI protein signal; coding regions of all non-structural proteins. The obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (PRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a recombinant Japanese encephalitis B virus constructed from encephalitis B virus and a recombinant genome, where the genome is inserted with an exogenous nucleotide sequence for recombination and capable of retaining its self-replication function. The virus is useful in producing the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are producible at low cost and have high immunoefficiency, in which the recombinant virus can efficiently express the antigen of hepatitis B virus with the safety and immunogenicity of attenuaced encephalitis B virus vaccines. The current sequence represents a PCR primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B produced by recombinant technique using encephalitis B virus as vector to express antigen gene of hepatitis B.

The mappified DNA sequences were used in the construction of a cutaryotic layered vector initiation system (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)

The sequences given in AAQ86200-15 are primers which were used in the production of alphavirus vectors expressing multiple heterologous genes. These vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS accomprise a.5 sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevente transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic

```
primer SHDVIF (AAT30816) contains a buffer sequence allowing enzyme digestion, a Sacī site, and a hepatitis delta virus (HDV) ribozyme sequence. It was used with nested primer HDVI7-68 (AAT30817) and reverse primer SHDV84R (AAT30818) to generate an HDV ribozyme. This antigenomic ribozyme can be placed between the polyk tract at the 3' end of a Sindbis virus-based eukaryotic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA alpha:virus structural protein expression cassettes - for producing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    primer HDV17-68 (AAT31151) is based on hepatitis delta virus (HDV) nucleotides 839-887. It was used with reverse primer HDV49-XC (AAT30850) for the PCR amplification of HDV sequences. A second primer pair, SIN-HDV (AAT31152) and SIN276-SPE (AAT31153), is used to amplify a fragment contg. Sindbis 5'-end sequences fused to HDV sequences. Overlapping Synthesis is used in a second round of PCR using primers HDV49-XC and SIN276-SPE. The resulting construct contains the expression cassette elements HDV ribozyme/Sindbis 5'-end 299 nts/Sindbis junction elements HDV ribozyme/Sindbis 5'-end 299 nts/Sindbis junction region/, designated pd5'26s. This was inserted into pcDNA3. Packaging cell line cassettes were constructed that allow inducible expression of

stimulate an immune response
                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                          ö
                                                             PCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and stimulate an immune response

The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytocoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA alpha:virus structural protein expression cassettes - for producing

The product is used in the course of the invention. The specifiaction describes an eukaryotic layered vector initiation system. Descend the sequence of the envention of system. Descend the sequence of the system comprises a eukaryotic promoter 5' of viral CDNA which initiates, in a susceptible target cell, 5' to 3' synthesis of RNA from the viral CDNA. The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response to an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I-restricted or an HLA class II-restricted immune response. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating

The specifiaction describes an eukaryotic layered vector initiation system, based on Sindbis. The eukaryotic layered vector initiation system comprises a eukaryotic promoter 5' of viral cDNA which initiates, in a susceptible target cell, 5' to 3' synthesis of RNA from the viral cDNA. The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response to an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I restricted or an HLA class I restricted or an HLA class I restricted or an HLA class I restricted immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryotic layered vector initiation system; stimulate; immune response; Sindbis; PCR primer; ss.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 25,

/note="Vector: pBluescript II SK-; Site_I: EcoRI; Site_2: XhoI; This library, constructed by John Davies and Jeffrey McDermott, combines coMAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         אווויסטעאטע 338 bp mRNA linear EST 27-FEB-2002

/note="Vector: pUC19; Site_1: EcoRI; Site_2: EcoRI; The library was prepared by George Rudenko using poly (A) selected RNA and Universal Riboclone cDNA Synthesis System (Promega). CDNA was synthesized using both random and oligo(dT) primers in separate reactions and equipped with EcoRI adaptors. Library was size-fractionated on agarose gels (for insert size >4000ps) and non-directionally cloned into EcoRI-dispected pUC19 vector. Blue/white selection on carbenicillin-containing plates was used to recover
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Contact: Olin Anderson

CABUL344 515 bp mRNA linear EST 21-NOV-2002 wll.pk0012.b7 wll Triticum aestivum cDNA clone wll.pk0012.b7 5' end, mRNA sequence.
with Fusarium graminearum. Total RNA, and poly(A) RNA were prepared and pooled from infected spike at 0, 6, 12, 24, 36 and 48 hours after inoculation, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in G. Muehlbauer lab at the University of Minnesota (Kruger, W.M., Muehlbauer, G.J., Pritsch, C., Vance, C.). The cDNA library should contain genes of both wheat and fungal pathogen origin. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

/note="Vector: Lambda Uni-ZAP XR, excised phagemid pBluescript SK; Site_1: BcoRI; Site_2: XhoI; Seeds were surface-sterilized, germinated and grown seeptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were prepared, a CDNA library was made in the poly(A) RNA were prepared, a CDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization proporcol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Jose="Vector: pUC19; Site_1: EcoR1; Site_2: EcoR1; The library was prepared by George Rudenko using poly (A) selected RNA and Universal Riboclone CDNA Synthesis System (Promega). CDNA was synthesized using both random and oligo(dT) primers in separate reactions and equipped with EcoR1 adaptors. Library was size-fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into EcoR1-digested pUC19 vector. Blue/white selection on carbenicillin-containing plates was used to recover positive clones."

On Nov 15, 2002 this sequence version replaced gi:23812823. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs cordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence cantigs with a consist entirely of whole senome shotgun sequence cantigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                * NOTE: Estimated insert size may differ from sequence length

* consists of 3 contigs. The true order of the pieces

* is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 17.2; DB 2; Length 236694; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
GenBank flat file format but are available as part
of this entry's ASN.1 file.
                                                                                                                                                                                     AC098616 159629 bp DNA linear PRI 21-MAR-
Homo sapiens chromosome 3 clone RP11-279118, complete sequence.

JITLE Direct SubmitsBlon JOURNAL Submitted (04-OCT-2002) Genome Sequencing Center, 4444 Forest Park	1 to 177226)	Wilson, K. Direct Submission	2	COMMENT On Oct 4, 2002 this sequence version repraced gr:z/30320.	Center code: WUGSC	web site: http://genome.whstl.edu Contact: submissions@watson.wustl.edu	Center project name: M_BB0104B23		NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping	clone sections once, or longer because we provide a small overlap between neighboring data submissions.	This semience was finished as follows unless otherwise noted:	all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >=	30); an attempt was made to resolve all sequencing problems, such as compressions and receats; all regions were covered by sequence	from more than one subclone; and the assembly was confirmed by restriction digest.	MAPPING INFORMATION: Mapping information for this clone was provided by Dr. Wes Warren,	Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://denome.wustl.edu

Sequence guairly assessment: This entry has been annotated with sequence quality	
	12755
All manually edited bases have been reduced to quality zero.	709
Quality levels above 40 are expected to mave less than	
Base-by-base quality values are not generally visible from the	703
GenBank flat file format but are available as part	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
of this entry's ASN.1 file.	10
This sequence was finished as follows unless otherwise noted:	6470
all regions were either double-stranded or sequenced with an	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
alternate chemistry or covered by high quality data (i.e., Phred	4611
quality >= 30); an attempt was made to resolve all sequencing	
problems, buch as complessions and repeats; all regions were covered by at least one plasmid subclone or more than one M13	* 1
subclone; and the assembly was confirmed by restriction digest.	4181

This sequence has been validated by Multiple Complete Digest fingerprinting. Comparison of the experimentally derived digest fingerprinting with sequence-predicted fragments is given below. The electronically-digested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC.

Sequence Validation:

fragments below a variable cutoff (approximately 400-800 bp) or resolved in the fingerprint and hence do not appear a table. There are no significant remaining discrepancies on the experimental and predicted values. Uniquely ordered mits are separated by dashed lines.

This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAS7641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleave site of the substrate (cleavage site of the substrate (cleavage site of the substrate nucleotide is present 5' to the cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= e

                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                  This ribozyme cleaves substrate SP1.1 (see AAZ5641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3 -UNNXNN -5. The substrate of the enzyme has the sequence 5 -H* *GNNHNN-3. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of sepresented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave to substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzyme also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20. .25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                        This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate Spl.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaR2P1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNXXNN-5'. The substrate of the enzyme has the sequence 5'-I'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) hase pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate enucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave tharspentic, biotechnological and disagnostic applications. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20. 25

This is the nucleotide sequence of ribozyme deltaRzP1.2. This ribozyme cleaves substrate SP1.2 (see AAZ57634). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*CNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site of sequenced by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave with the substrate for example an inherited disease. The enzymes also have other therapeutic, biotechnological and disagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the

The invention relates to finding nucleic acids which are differentially proteins and their encoding nucleic acids which are differentially expressed in colorectal or gastric cancer. 7 of the 8 CKG genes cidentified showed increased expression in colorectal cancers while the eighth CCX protein. LAPTWAbeta (CCX8), showed increased expression in colorectal cancers while the cighth CCX protein. LAPTWAbeta (CCX8), showed increased expression in colorectal cancers while the cighth (CCX7) were known but had not previously been associated with colon cancer, and 5 were novel. The novel colon cancer-associated genes are in MCX1 (CCX1, ADL66345); C20orf20 (CCX1, ADL66351); and NFX11 (CCX1, ADL66345); C20orf20 (CCX1, ADL66352) and ADL66352 and ADL66353; and NFX11 (CCX1, ADL66349); LEWDIL (Doth designated CGX4, ADL66351, ADL66351, ADL66352, ADL66352, ADL66352, ADL66353, ADL66352, ADL663
   invention relates to human colon and gastric cancer-associated (CGX)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 primer used in an example of the invention.

ö A set of E.coli-BCG shuttle plasmids were constructed to permit prodn. of IL-2. Three sets of paired oligo primers were utilised in the PCR with appropriate templates to produce insert DNAs with ends suitable for cloning in the plasmid pWV261. The oligo primers were AAQ88793-Q88798, primer nos. 1-6 respectively. The rat and mouse IL-2 upstream primers no. 1 and no. 3 respectively were constructed to anneal with the IL-2 coding regions starting at codon 21 thereby excluding their native signal peptide regions. The BCG alpha antigen downstream primer no. 4 terminated at the sequence encoding the putative protease cleavage site ala-gly-ala (Terasake et al., FEMS Lett. S8:273-276 1989. (Updated on 25-MAR-2003 to correct PN field.) This sequence represents PCR primer used to isolate DNA encoding a glucagon-like peptide-1 (GLP-1) mutein. The invention relates to a method for treating type II diabetes mellitus, by administering a GLP-1 or a GLP of mutein, particularly the mutein GLP-1GJY8. The GLP-1 mutein is an insulinotropic peptide. The method is used to treat type II diabetes (non-insulin dependent diabetes mellitus) and obesity Glucagon-like peptide-1; GLP-1; mutein; type II diabetes mellitus; insulinotropic peptide; non-insulin dependent diabetes mellitus; obesity; therapy; PCR primer; ss. New recombinant mycobacteria and plasmids - express cytokine(s), lymphokine(s), enzymes, etc extracellularly, for use as BCG vaccines and in cancer therapy. Gaps Treating type II diabetes mellitus and obesity using glucagon like ö PCR primer for glucagon-like peptide-1 mutein coding sequence. Score 14.4; DB 2; Length 39; Pred. Also described are: (I) a drug composition containing to containing the DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against lawkaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ATPase, Hsp70, heat shock protein, cytotoxic T lymphocyte, CTL, immune response, infectious disease, malaria, cytotoxic T cell;

                                                                                                                                                                                                                                                                                                                                                                                           요
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                               peptide containing a CTL (cytotoxic T lymphocyte) epicpe recognised by cytotoxic T cells and a protein containing the ATPses domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HPIV-3; human parainfluenza virus type 3; vaccine; ribozyme; PCR; primer;

Thus primer encloses the steel of a negatical action of the second primer encloses the steel of the second primer for the second primer for the second primer (see AAV70404), which contains a sequence from the 3' untranslated region of thuman parainfluenza vitus type 3 (HPIV-3) is mRNA, through to the trailer portion of the HPIV-3 genome (see AAV70404), and which also primes synthesis of the ribozyme, in the PCR amplification of the ribozyme. The product was used in the construction of a full-length cDNA clone of HPIV-3. The invention relates to a system for generating recombinant HPIV such as a clone comprising a nucleotide sequence that encodes a full-length, so positive sense, anti-genome of HPIV. The invention also relates to a method of preparing recombinant HPIV 3 having site-directed mutations. Production of recombinant HPIV clones enables analysis of HPIV cranscription and replication in a cell-free system. A system which permits production of recombinant HPIV that is genetically engineered to contain site-specific mutations is useful for identifying attenuating contain site-specific mutations is useful for identifying attenuating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New vector (EV) used to express an antigen for vaccination, e.g. against human immune deficiency virus.
                                                                                                                                                                                                                                                                                           This primer encodes the 3' end of a hepatitis delta virus antigenomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alphavirus, replicon, expression vector, heterologous splice site, RNA splicing, viral RNA replication, antigen, vaccination, therapy,
New human parainfluenza virus (HPIV) clone, and - methods of clone production and introduction of site-specific mutations.

ö

NS1 protein signal; coding regions of all non-structural proteins. The charled vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNR clone (PRS/FLD2). The recombinant virus vectors were transfected into baby lines. This sequence corresponds to an oligonucleotide used in the

recombinant replicon of the invention.

```
This invention describes the construction of a novel expression vector.

(EV) containing an alphavirus replicon having a heterologous splice site.

The expression vector contains (i) a DNA molecule (I) complementary to at least part of an alphavirus RNA genome, and (ii) inserted into a region of (II) that is not essential for its replication, a heterologous DNA (II) under control of a promoter. (I) includes at least one heterologous splice site (HSS) to prevent aberrant RNA splicing of the alphavirus and is the complement of the complete alphavirus genomic region essential for replication of viral RNA. The expression vector is used to express (II) in humans or animals, e.g. to express an antigen for vaccination (against human immune deficiency virus) or to produce a therapeutically active protein or peptide. Introducing an HSS: (I) makes it more likely that any protein will occur at this site, rather than at a cryptic splice site; (2) restores function of the alphavirus when eliminated, and (3) may improve transport of RNA from the nucleus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; cytostatic; virucide; dengue virus; recombinant replicon; deletion; preM protein; C protein; NS1 protein signal; vaccine; cervical cancer; viral disease; antigen; dendritic cell; immune response;

constructed from encephalitis B virus and a recombinant genome, where the genome is inserted with an exogenous nucleotide sequence for recombination and capable of retaining its self-replication function rivers is useful in producible the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are producible at low cost and have high immunoefficiency, in which the recombinant virus can efficiently express the antigen of hepatitis B virus with the safety and immunogenicity of attenuated encephalitis B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B produced by recombinant technique using encephalitis B virus as vector to express antigen gene of hepatitis B.

```

A dengue virus recombinant replicon has a deletion of the complete coding sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of

Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.

It was used with nested primer HDV17-68 (AAT30817) and forward primer SHDV1F (AAT30815) to generate an HDV ribozyme. This antigenomic ribozyme can be placed between the polyA tract at the 3' end of a Sindbis virus-based eukaryolic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.
